

# Stability of Variable Step-Size Methods

Allison D Heard

`a.heard@auckland.ac.nz`

Mathematics Department, The University of Auckland, New Zealand

Most of the work on the stability of numerical methods for ordinary differential equations assumes constant step size. In that case stability involves powers of the stability matrix, but that is not sufficient for the case of variable step size. I will review some approaches to bounding products of matrices from a given class, and the application to backward differentiation formulae and general linear methods.
