

Lower bound on the blow-up rate of the axisymmetric Navier-Stokes equations

Tai-Peng Tsai

Abstract

Consider axisymmetric strong solutions of the incompressible Navier-Stokes equations in \mathbb{R}^3 with non-trivial swirl. Such solutions are not known to be globally defined, but it is shown that they could only blow up on the axis of symmetry. Let z denote the axis of symmetry and r measure the distance to the z -axis. Suppose the solution satisfies the pointwise scale invariant bound $|v(x, t)| \leq C_*(r^2 - t)^{-1/2}$ for $-T_0 \leq t < 0$ and $0 < C_* < \infty$ allowed to be large, we then prove that v is regular at time zero. This is a joint work with C.-C. Chen, R. M. Strain and H.-T. Yau.
