Top Ten (95% Credible Interval: Eight to Eleven) Things Public and Population Health Researchers Might Need and Want from Statisticians

A current trend occurring in many health research disciplines is a growing requirement for explicit activities devoted towards "knowledge transfer". Workshops such as this one provide evidence that that trend may be influencing other disciplines, including statistics. Knowledge transfer begins with dialogue to understand what "receptors" require. In this presentation, one health researcher will highlight areas where insight on the part of statisticians may foster greater collaboration in health research projects, including theoretical perspectives, frameworks for implementation, guiding principles, and collaborative attitudes and skills.
